

Inverter series DC reactor

Overview

Inverter DC reactors reduce electrical harmonics, enhancing the quality of power delivered to sensitive equipment. By limiting inrush current, these reactors protect internal components from damage during startup, extending their lifespan.

Inverter DC reactors reduce electrical harmonics, enhancing the quality of power delivered to sensitive equipment. By limiting inrush current, these reactors protect internal components from damage during startup, extending their lifespan.

An inverter DC reactor plays a crucial role in ensuring the smooth operation of your inverter system, which is a key function of inverter technology. It reduces electrical harmonics, which can interfere with sensitive equipment. By limiting inrush current, it prevents sudden power surges that could.

Use this reactor to improve the input power factor or reduce harmonics on the inverter power side. The use of the inverter may cause harmonic currents on the power side to affect the equipment of the same power system. Consider installing the reactor to comply with the harmonic suppression.

To suppress such harmonic current, the power-factor-improving compact AC reactor (FR-HAL) and the DC reactor (FR-HEL) are available. (For the 75K or higher inverter, always connect a DC reactor. Select a DC reactor according to the applied motor capacity.) By attaching the EMC filter connector to.

Reduce the current ripple in DC circuit, ensuring continuous current when inductance value reach to a certain degree. Reduce and prevent the rectifier bridge damage and capacitance overheating caused by pulse current. Improve power factor, reduce the AC pulse to the DC busbar. Limit grid voltage.

An AC or DC reactor that connects to the input side of an inverter that improves the power factor and reduces harmonic currents on the input side. • FR-HAL series AC reactors are compatible with A800, A800 Plus, F800, E700, E700PJ, and D700 series inverters. • FR-HEL series DC reactors are.

span by absorbing the disturbances from the power line, preventing overvoltage trips, improving total power fact to steel core which is constructed of electrical grade steel laminations and copper wound coils that form a magnetic field as

current flows through it. The magnetic field limits the rate.
