

# Kd solar container communication station flow battery

## Overview

---

A flow battery, or redox flow battery (after reduction-oxidation), is a type of electrochemical cell where chemical energy is provided by two chemical components dissolved in liquids that are pumped through the system on separate sides of a membrane. Ion transfer inside the cell (accompanied by current flow through an external circuit) occurs across the membrane while the liquids circulate. HistoryThe (Zn-Br<sub>2</sub>) was the original flow battery. John Doyle filed patent on September 29.

A flow battery is a rechargeable battery in which one or more dissolved electroactive elements flow through an electrolyte that reversibly converts to another state.

Redox flow batteries, and to a lesser extent hybrid flow batteries, have the advantages of:

- Independent scaling of energy (tanks) and power (stack), which allows for a cost/weight.

The cell uses redox-active species in fluid (liquid or gas) media. Redox flow batteries are rechargeable (secondary) cells. Because they employ liquid rather than solid electrolytes.

The hybrid flow battery (HFB) uses one or more electroactive components deposited as a solid layer. The major disadvantage is that this reduces decoupled energy and power. The cell contains one battery electrode and a liquid electrolyte.

Compared to inorganic redox flow batteries, such as vanadium and Zn-Br<sub>2</sub> batteries, organic redox flow batteries' advantage is the tunable redox properties of their active components. As of 2021, organic RFB experience.
