

Outdoor energy storage energy suitable for Spain

Overview

The results of this thesis demonstrate that the storage strategy in Spain must be based on the technologies of pumped hydro, batteries and deposits of molten salts as they are technologies that have features that allow them to work with large volumes of energy at a low economic cost.

The results of this thesis demonstrate that the storage strategy in Spain must be based on the technologies of pumped hydro, batteries and deposits of molten salts as they are technologies that have features that allow them to work with large volumes of energy at a low economic cost.

Spain has launched an ambitious €700 million (around \$796 million) program to increase its energy storage capacity. This plan will add 2.5 to 3.5 gigawatts (GW) of storage. It includes pumped hydro, thermal energy storage, and battery systems. The goal is to improve how Spain uses renewable energy.

Energy storage systems in Spain are a key element in the fight against climate change, as they help us to address the challenge of the energy transition. These systems make renewable energy production more flexible; and therefore help us to guarantee its integration into the Spanish electricity.

Spain is rapidly becoming a hotspot for investment in energy storage. As the country continues its transition to renewable energy sources, demand for flexible grid-balancing solutions has generated growing interest in battery energy storage systems (BESS). A recent M&A Community webinar examined.

The 2023 NECP proposes a 173% increase (or 85 GW) in renewable capacity by 2030 from current capacities¹; storage² is expected to increase by 487%, or 15 GW from installed capacity. Long Duration Energy Storage (LDES) can ensure renewable energy is utilised in the system while decreasing reliance.

To achieve this goal, it is necessary to have a 100% renewable system and carry out a storage strategy that helps in the integration of renewables. The objective of this study is to contribute to the development of a national strategy for storage systems in Spain up to 2050. To do that, it is.

Energy storage has become a key piece of the electrical future in Spain, amidst the

advance of renewable energies and the progressive withdrawal of nuclear generation. Ensuring the network stability Faced with production variability, meeting peak demand or responding to potential blackouts are some.
