

# Radio communications and base stations

## Overview

---

In radio communications, a base station is a wireless communications station installed at a fixed location and used to communicate as part of one of the following: a wireless telephone system such as cellular CDMA or GSM cell site.

In radio communications, a base station is a wireless communications station installed at a fixed location and used to communicate as part of one of the following: a wireless telephone system such as cellular CDMA or GSM cell site.

Base station (or base radio station, BS) is - according to the International Telecommunication Union 's (ITU) Radio Regulations (RR) [1] - a " land station in the land mobile service." A base station is called node B in 3G, eNB in LTE (4G), and gNB in 5G. The term is used in the context of mobile.

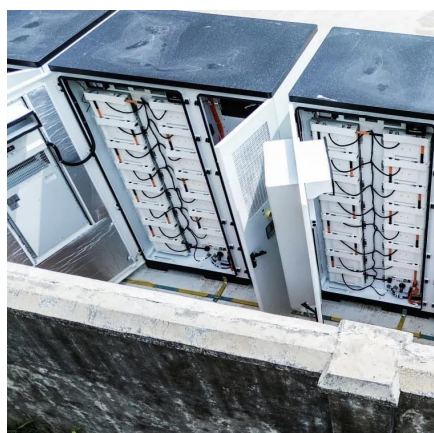

These base stations provide the cell with the network coverage which can be used for transmission of voice, data, and other types of content. In radio communications, a transceiver is a two-way radio that combines both a radio transmitter and a receiver that exchanges information in half-duplex.

Base station antennas are installed in such a way that radio-wave exposure in public areas is well below the established safety limits. Mobile phones and other mobile devices require a network of base stations in order to function. The base station antennas transmit and receive RF (radio frequency).

In the world of radio communications, a radio base station plays a vital role in ensuring reliable and seamless communication across a wide area. Whether used in mobile networks, professional communication systems, or emergency response scenarios, base stations are essential for facilitating voice.
