

United Communications 5G Base Station

Overview

5G is the fifth generation of technology and the successor to 4G. First deployed in 2019, its technical standards are developed by the 3GPP in cooperation with the ITU's IMT-2030 program. 5G networks divide coverage areas into smaller zones called cells, enabling devices to connect to local base stations via radio.

Is 5G a critical market for base stations?

The 5G revolution is poised to transform the communication landscape, and the United States is emerging as a critical market for 5G base stations.

How big is the 5G base station market?

Macro cells represented USD 22.9 billion and 61.3% of the 2024 5G base station market share, providing umbrella coverage and mobility anchor services. Yet small cells are forecast to expand at a 29.4% CAGR, pushing their slice of the 5G base station market size toward USD 50 billion by 2030.

How does 5G work?

5G networks divide coverage areas into smaller zones called cells, enabling devices to connect to local base stations via radio. Each station connects to the broader telephone network and the Internet through high-speed optical fiber or wireless backhaul.

Should a 5G base station have built-in security?

Officials should consider hardware with built-in security to minimize that damage that can be done if physical control is lost. A new class of private 5G base stations, such as the Intel and Trenton Systems' IES.5G, enables advanced high-performance computing capabilities in a nearly plug-and-play solution.
